

Hey all , I pitched the idea of creating a trash collector that will pick up trash around cities. It would be a robotic collector based on a drone creation. There will be 4 parts in the drone and those parts will be very big to store the trash. One part will be for reusing trash like cardboard, etc. The other will be recycling trash that will help say for soil, we can put worms in the process. They will remove and separate bacteria. The third part will be magnetized waste. In this part there will be a big magnet that attracts waste that is hard to separate. The fourth part of the drone will be for purifying the air with the help of a special mechanism that we will talk about later. This will all be powered by wind energy and will be made by wolverine cloth material. It is an indestructible cloth. I am voting yes for my idea pls vote yes or no.. We can always refine the idea too
